Agile VS DevOps

- All about Agile
- DevOps
- Major Differences
- The Similarities

Agile

Definition:

Agile is a software development approach that is lined up with the qualities and standards of Agile Manifesto.

Agile methodology founded on the iterative development, which centers around partnerships of the cross-functional groups to get the required solution.

It is the practice to promote the development and testing throughout the software development lifecycle of the project.

The Agile Manifesto Essentially Emphasizes The Following Viewpoints

A. Interaction of the people on devices and process

B. Establishing co-operation with the potential clients over harmonization of terms the agreement

C. Discussion on working programming

D. Acknowledging any changes in the plan

You can execute the agile procedure in several ways as scrumban, scrum or Kanban and so on.

The Agile offers an exceptionally intensive shift in the working procedure, which now and then can upset the working of the entire business enterprise.

DevOps

DevOps is basically a combinations of the two words that is Development and Operations.

DevOps development is technique used by IT professionals and teams to collaborate and create a relationships with each other.

The DevOps is acknowledged as it has introduced a work culture and improving the skills.

Just as Agile, DevOps is also possible to incorporate with several ways including scrum, kanban, etc.

Nonetheless, it is a technology and enabling companies for smooth business operations.

Major Differences of Agile and DevOps

1. Methodology and Deployment

2. The Number of Team Member Required

3. Cross-Functionality Vs. Segmentation

4. The difference in Approach to Planning

5. Documentation and Interaction

1. Methodology and Deployment

Agile

- Agile is a software development methodology.
- Development team while following agile only focuses on creating the software and launching it.
- Developers with Agile Methodology, have to create the software from the scratch.

DevOps

- DevOps has no role to play in the software development.
- DevOps uses a pre-built software that can be easily deployed and is reliable.
- Developers with DevOps can even use waterfall method to develop the app.

2. The Number of Team Member Required

Agile

- With Agile, you do not need a big team for your project.
- Agile is focused on getting smaller teams to collaborate with each other so it can react quickly to the ever-changing consumer needs.

DevOps

- DevOps, on the other hands, demands the collaboration of different teams works together.
- DevOps brings together two large siloed teams to allow for quicker software releases.

3. Cross-Functionality Vs. Segmentation

Agile

- The Agile methodology enables every individual to be skilled in all sorts of works and becomes an all-rounder, where they can substitute each other in the project without hampering.
- Agile methodology thus encourages efficiency, quality, and improves communication among team members.

DevOps

- On the other side, DevOps requires two separate teams; the development and operation professionals for the project.
- Both the teams require close coordination with one another to obtain the best possible results.

4. The difference in Approach to Planning

Agile

- Agile development is managed in units of sprints, where at specific regular intervals developers develop new versions and updates. The duration is much less than a month for each sprint.
- Developers get a closer time frame for it where they have to implement various required functionalities.

DevOps

- DevOps strives for deadlines and benchmarks to optimize the business operations. The ideal goal is to deliver code to production DAILY or every few hours.
- DevOps do not run short with time for the deployment of updates but aim to get maximum business operations.

5. Documentation and Interaction

Agile

- Scrum is surely a standout amongst the widely known method for performing the Agile methodology. It is generally a framework that is actually used for doing difficult and harder works.
- Agile method is to give priority to the working system over complete documentation.

DevOps

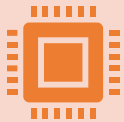

- The teamwork here is different, the operation team requires intensive and updated skills on development procedure to properly address systems for the deployment.
- In the DevOps, process documentation is foremost because it will send the software to the operational team for deployment.

Major Similarities of Agile and DevOps

Both are deeply secure software development programs where Agile drives DevOps and DevOps urges Agile to be intensive.

Both Agile and DevOps have widely adopted and implemented the lean philosophy in the extensive amount.

Collaboration is another aspect where, both the team required to share updates regarding the progress.

Thank you.
